

ENTERPRISE ATTRITION TOOL: INTERACTIVE RISK DASHBOARD

SEBASTIAN THURM
HEAD OF DATA, MACHINE LEARNING AND AI

STRATEGIC OBJECTIVE: BRIDGING THE GAP BETWEEN STATIC DATA AND EXECUTIVE ACTION THROUGH REAL-TIME "WHAT-IF" SIMULATIONS AND DEPARTMENT-WIDE RISK REPORTING.

Executive Impact:

Standard HR reports are historical; this tool is predictive. It transforms the project's "Recall-First" machine learning model into a **functional interface for non-technical leadership**. By identifying 51% of potential leavers before they exit, it provides the critical lead time required to implement targeted retention strategies and avoid turnover costs that typically reach 1.5x–2x an employee's annual salary.

Interactive Capabilities

- **Individual "What-If" Analysis:** Empower managers to adjust behavioral levers like Overtime and Monthly Income in real-time to see exactly how policy changes impact an individual's attrition risk score.
- **Strategic 8 Alignment:** The tool is built exclusively around the Strategic 8 Drivers (e.g., Job Level, Distance from Home, and Promotion History), ensuring management focus remains on actionable metrics rather than synthetic data noise.
- **Bulk Enterprise Reporting:** Features a department-wide CSV upload capability to instantly flag high-risk flight profiles across entire teams, moving HR from individual case management to organization-wide strategy.
- **Recommendation Integration:** Model outputs are directly linked to the 8 Strategic Recommendations, specifically identifying which employees require immediate "Stay Interviews," workload audits, or "Success Roadmaps".

The Outcome:

The primary outcome of this tool is the **conversion of raw data into actionable intelligence**. Instead of waiting for a resignation letter, leadership can now simulate interventions. For example, by adjusting the "Overtime" slider, a director can quantitatively see the drop in exit probability, proving the ROI of a departmental workload cap before it is even implemented.

How to Use the Interactive Dashboard:

To extract maximum business value, leadership should follow this three-step standardization:

1. **Individual Risk Simulation:** Use the "Individual Analysis" tab to adjust specific behavioral levers (e.g., Monthly Income or Overtime) for high-value employees. This quantifies the exact impact of a potential retention offer or workload change before it is officially proposed.
2. **Departmental Health Audits:** Utilize the "Bulk CSV Upload" feature monthly to scan entire departments. This identifies "Flight-Risk Clusters" where departmental culture or localized management issues may be driving turnover.
3. **Cross-Validation with HRIS:** Compare dashboard "Risk Scores" against qualitative manager notes to prioritize which employees require immediate intervention based on the model's 51% Recall rate.

The Bottom Line Summary:

This model moves HR from a cost center (replacing talent) to a strategic asset (preserving talent). By focusing on the Strategic 8 behavioral drivers, we have identified the specific tipping points where employees decide to exit. We no longer wait for a resignation; **we have the lead time required to intervene, keep our top performers, and protect the bottom line.**
