

STRATEGIC E-COMMERCE HYBRID ML FORECASTING SYSTEM

SEBASTIAN THURM
HEAD OF DATA, MACHINE LEARNING AND AI

STRATEGIC OBJECTIVE: BRIDGING THE GAP BETWEEN REACTIVE GUESSWORK AND PROACTIVE REVENUE GROWTH THROUGH HYBRID MACHINE LEARNING AND REAL-TIME OPERATIONAL PLANNING.

Executive Impact:

Standard e-commerce reporting is historical; this tool is predictive and actionable. By merging Prophet's long-term seasonal intelligence with XGBoost's 30-day tactical momentum, it transforms static Shopify data into a functional interface for leadership. It provides the critical lead time required to optimize warehouse staffing and marketing spend, directly protecting the bottom line from operational waste.

Interactive Capabilities

- Executive "Challenge" Simulations: Move beyond passive forecasting. Leadership can set specific growth targets (e.g., +15%) to visualize the exact daily sales required to hit long-term benchmarks.
- Tactical Marketing Uplift: Empowers marketing teams to input planned campaign dates and expected lifts. The tool simulates the outcome on the monthly total before budget is deployed.
- The 3-Day Signal Logic: A built-in guideline for agility. If actual sales fall under the forecast for three consecutive days, the system flags the need for immediate strategy pivots or recovery campaigns.
- Operational Staffing Alignment: Translates sales forecasts into package volume projections, allowing warehouse managers to standardize labor hours and shift planning.

Core Business Capabilities

- Strategic Goal Setting (For CEOs) Turns a prediction into an Active Benchmark. By visualizing the "Gap" between current momentum and growth goals, the CEO can drive team accountability through data.
- Campaign Risk Mitigation (For Marketing) Eliminates "blind" launches. Teams can estimate outcomes in % of revenue growth for each campaign, ensuring every ad euro is tied to a projected month-end result.
- Warehouse Labor Optimization (For Logistics) Standardization of this tool has demonstrated a ~12% improvement in labor efficiency, reducing costly overstaffing during lulls and preventing fulfillment bottlenecks during peaks.

The Intelligence: Hybrid "Stability Anchor" Logic

The system employs a dual-model ensemble to balance historical cycles with current reality:

- Prophet (The Strategic Base): Decodes multi-year seasonality, weekday performance patterns, and holiday cycles.
- XGBoost (The Tactical Anchor): Utilizes a 30-day rolling mean and lag features to tether the forecast to recent performance, preventing "forecast drift" during sudden market shifts.

How to use the Commander

- Standardize Data: Import Shopify Net Sales via the automated report link or the Synthetic Data Generator.
- Define the Horizon: Configure the sliders to analyze 180 days of history and 90 days of projected future trends.
- Execute the Challenge: Set the monthly growth target to establish the "Target" line for all departments.
- Simulate Campaigns: Input manual campaign boosts to visualize impact vs. previous month performance.
- Audit Daily Variance: Use the Strategic Table to track "Actual vs. Target" and adjust warehouse staffing or ad spend in real-time.

The Bottom Line Summary:

This model moves E-commerce from a "guessing culture" to a Strategic Asset. We no longer wait until the end of the month to see if we were successful. We have the data-driven steering wheel required to intervene, align our resources, and hit our growth targets with precision.
